I. Challenges Faced

One significant challenge we faced was in choosing a specific method in which to render the car. The rules were one `Rectangle` for the body of the car, one `Triangle` for the nose, and four smaller `Rectangle`s for the car's wheels.

The way we ended up choosing to implement this was by basing all polygons rendered for the car on a single point within the car's body (to be precise, the centroid of the car body's rectangle). Another issue we encountered was with the rotations. There was some initial confusion on our part with the outputs we were seeing because we had forgotten that the y-axis values increased going *down*, not up.
